# Development Scenarios for Drop-In and Non Drop-In Fuel Options

Gunnar Quante, Nils Bullerdiek, Ulf Neuling, Martin Kaltschmitt

**Reduce aviation's greenhouse gas (GHG) emissions**

**Use a suitable, renewably sourced fuel**

Initial assessment - today

Possible future developments

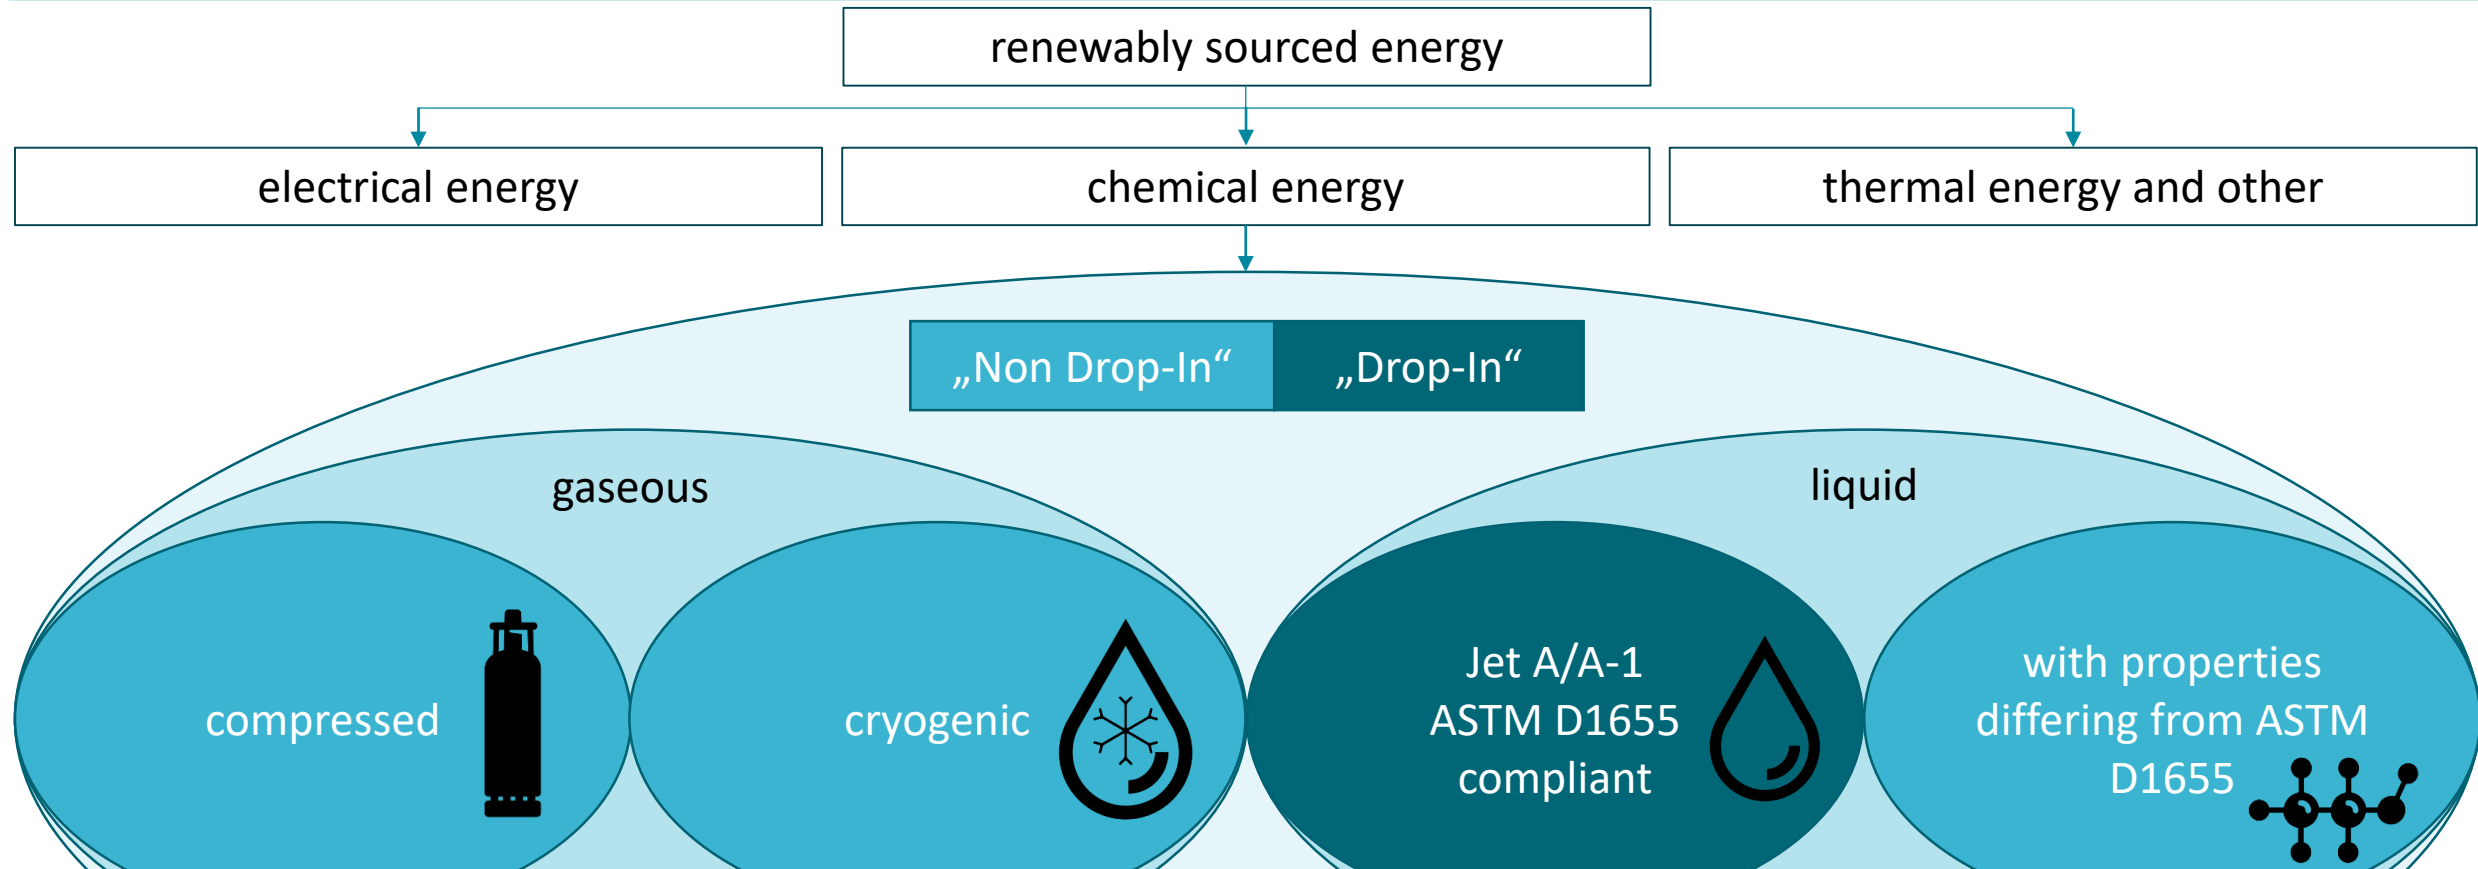

Assessment – year 2050

Goal: Assessment of scenarios for the development of (Non) Drop-In Aviation Fuels

# Initial assessment - today

# Selection of fuel options

## Selection criteria:

1. discussed as renewable aviation fuels
2. already produced at scale from renewable sources
3. potentially central role for defossilisation of overall energy system

# Potential renewable fuel options – present state

liquid					gaseous		
„Drop-In“	„Non Drop-In“						
Blend SK	Neat SK	Methanol	Ethanol	Butanol	Ammonia	Methane	Hydrogen
< 0.2		< 1	100	-	-	0,1	-
• aviation	• chemical • transport	• chemical • pharmaceutical • transport	• chemical	• agriculture • chemical • pharmaceutical	• energy • chemical	• energy • chemical	
			• chemical • <b>transport</b>	• agriculture • chemical • pharmaceutical • <b>energy (storage)</b>	• energy (storage) • chemical • <b>transport</b>	• energy (storage) • chemical • <b>production (e.g. steel)</b>	

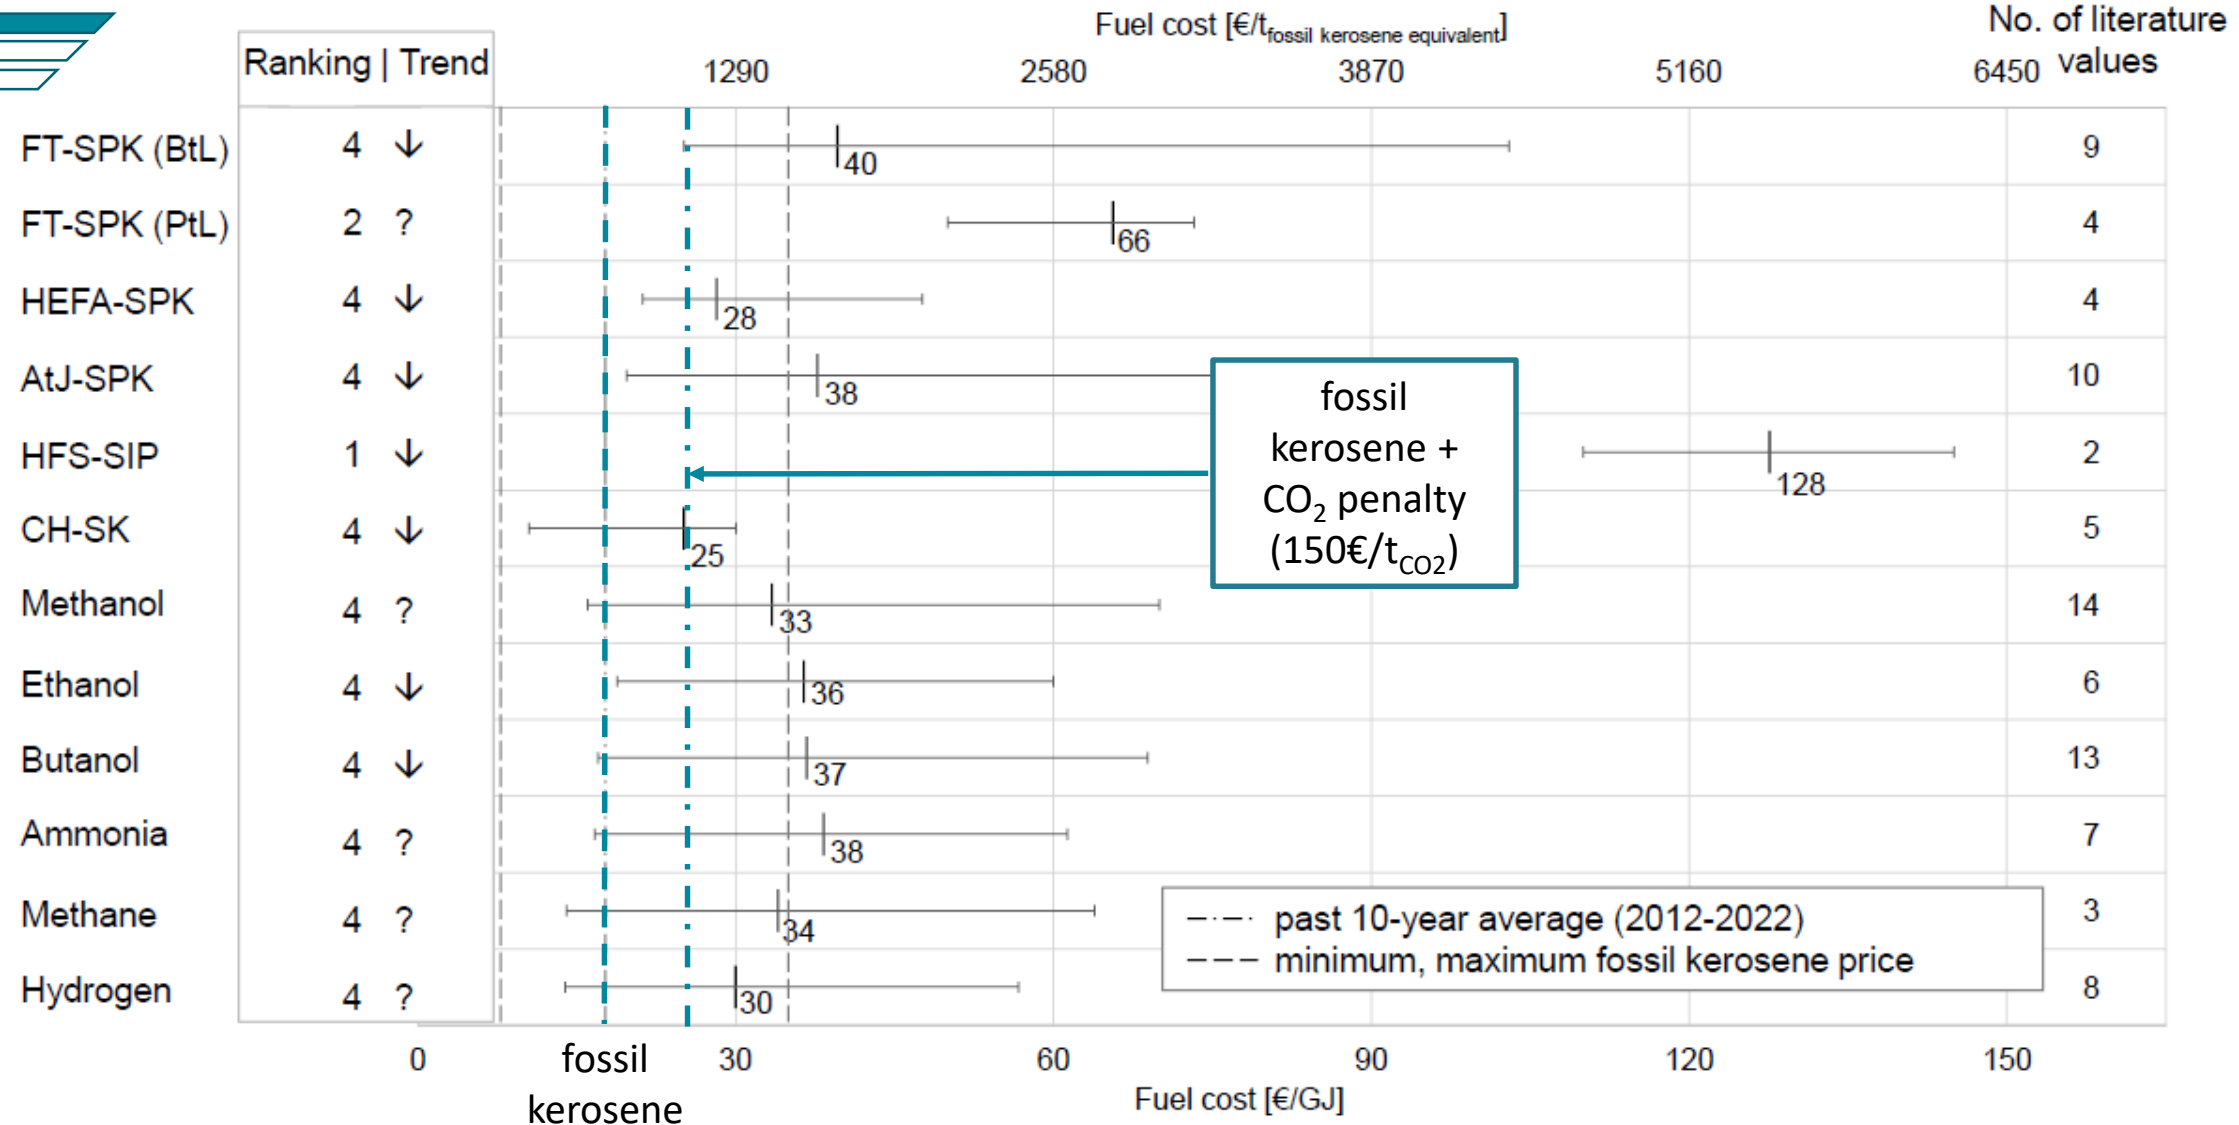

# Static criteria – energy density

Energy density:    ◇ Synthetic Kerosene    □ Alcohols    ○ Gases

# Dynamic criteria – fuel provision cost

# Potential renewable fuel options – present state

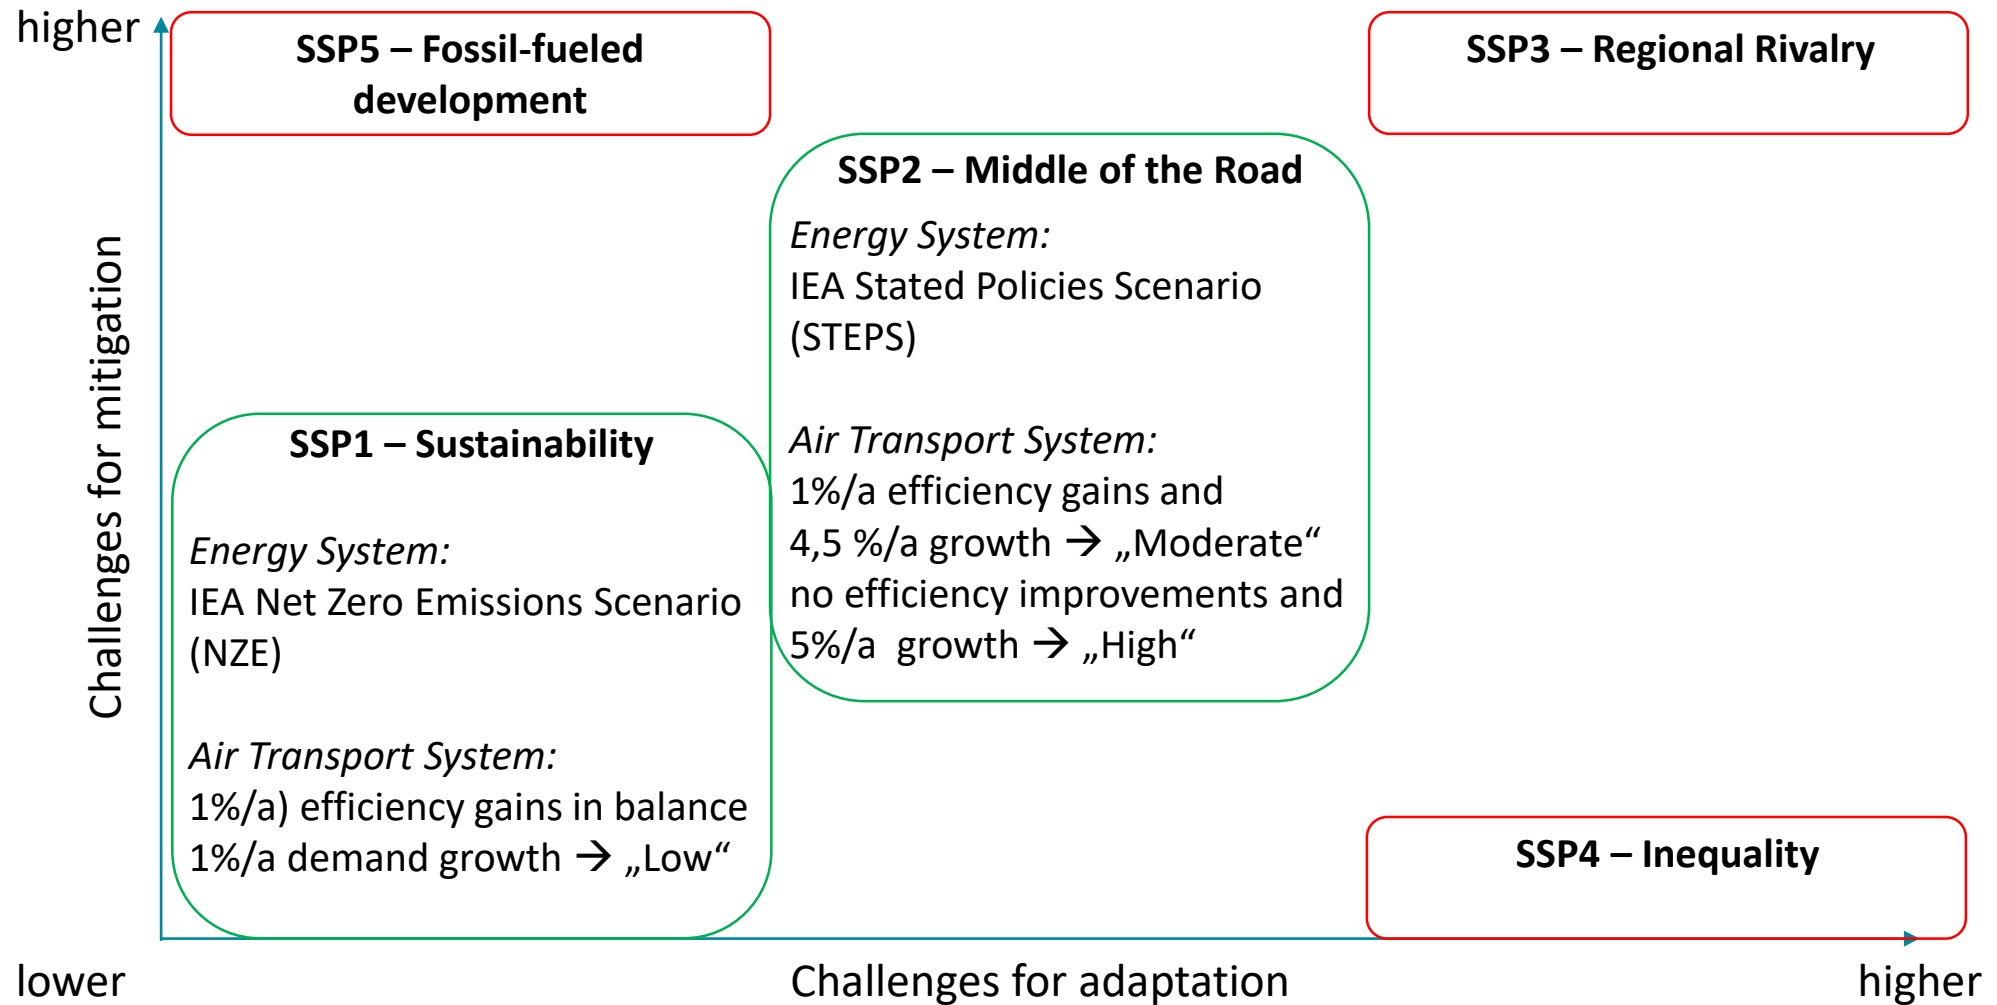

Fuel option	Feedstock and Production			Logistics and airports		Fuel and aircraft		Economics and Environment	
	Feedstock potential	Production capacities	Fuel conversion efficiency	Logistics Infrastructure	Airport Infrastructure	Fuel properties	Aircraft modifications	Lifecycle CO2eq	Fuel costs
Blended Synthetic Kerosene									
Neat Synthetic Kerosene									
Methanol									
Ethanol									
Butanol									
Ammonia									
Methane									
Hydrogen									
Ranking	„very disadvantageous“		„disadvantageous“		„neutral“	„advantageous“	„very advantageous“		

# Future Developments

# Derivation of aviation energy demand scenarios

Insignificant shares of renewably sourced energy for aviation

Increasing shares of renewably sourced energy for aviation

[1, 2]

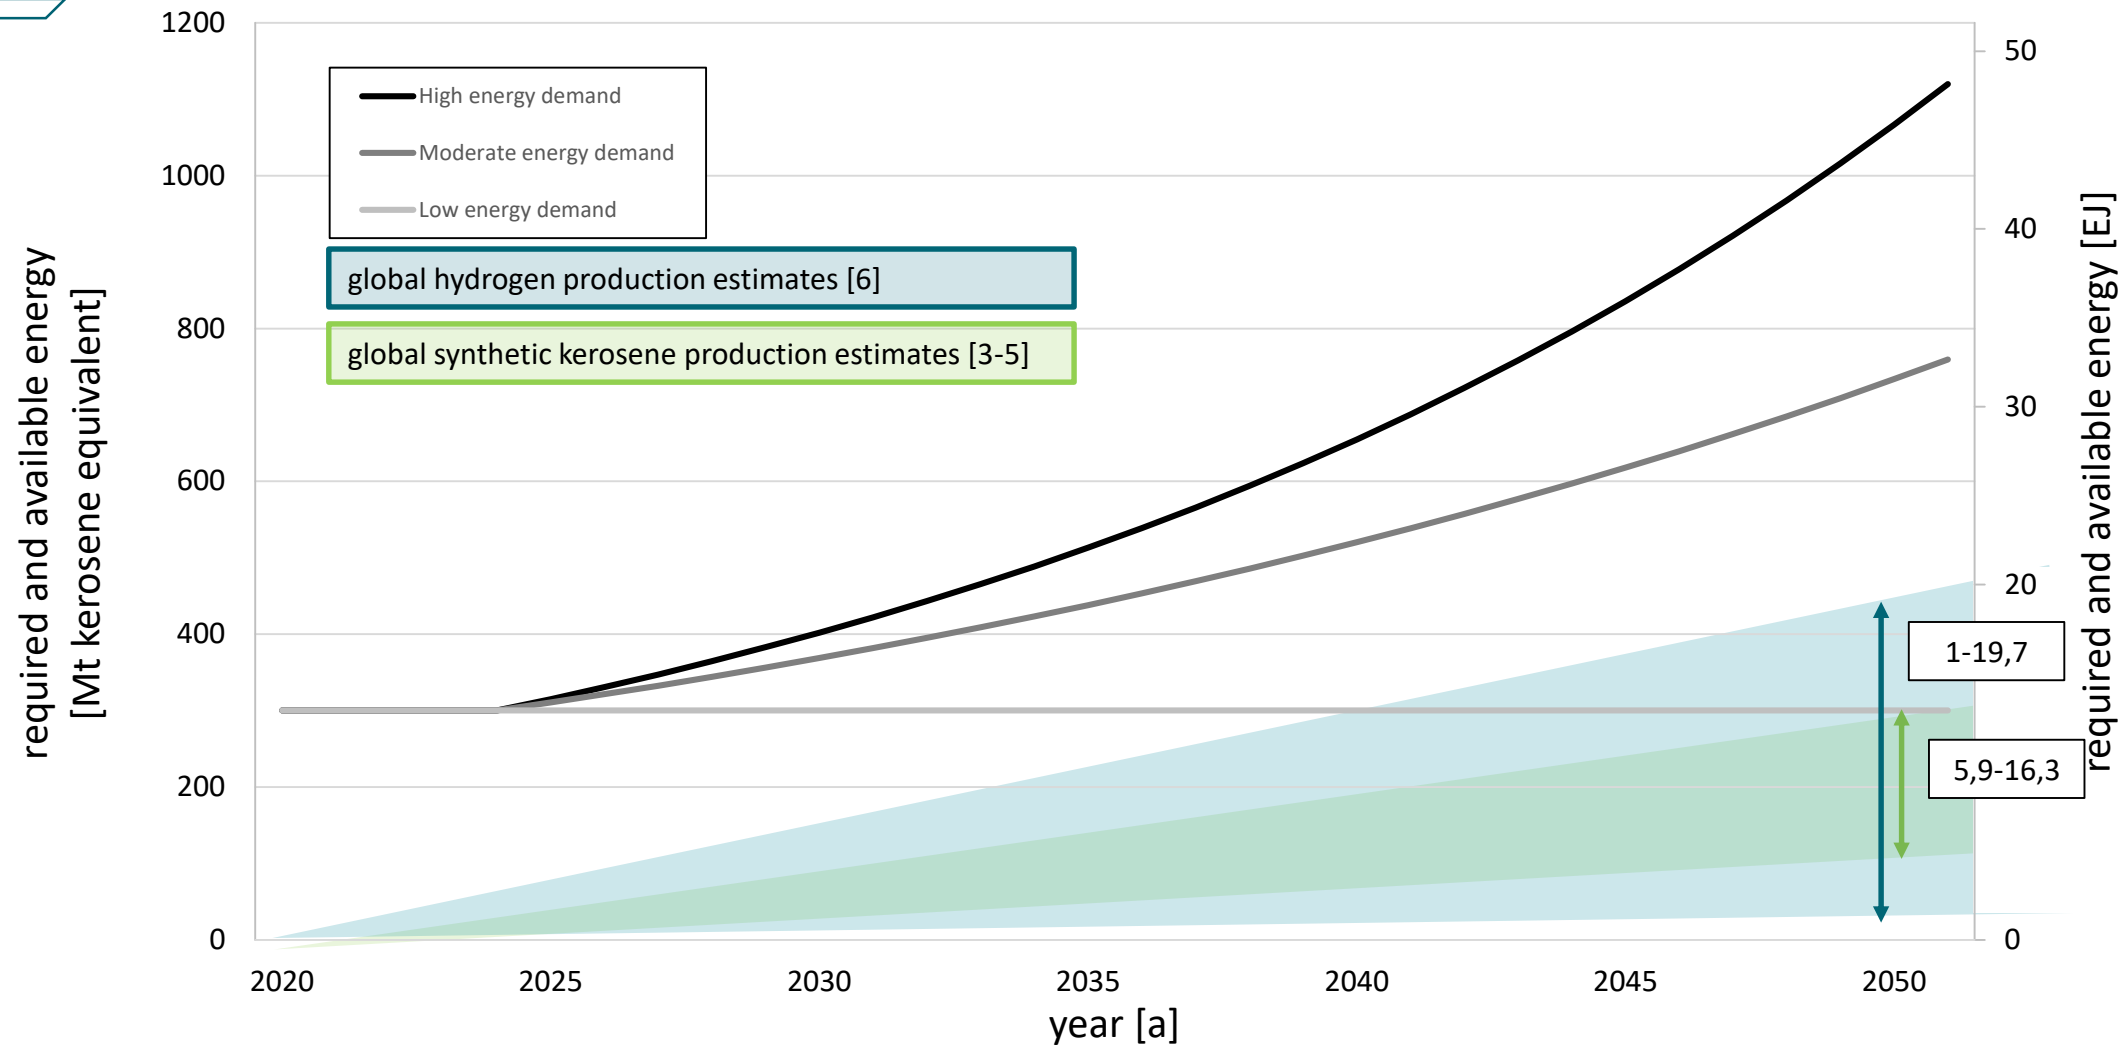

# Global aviation energy demand vs fuel option's availability

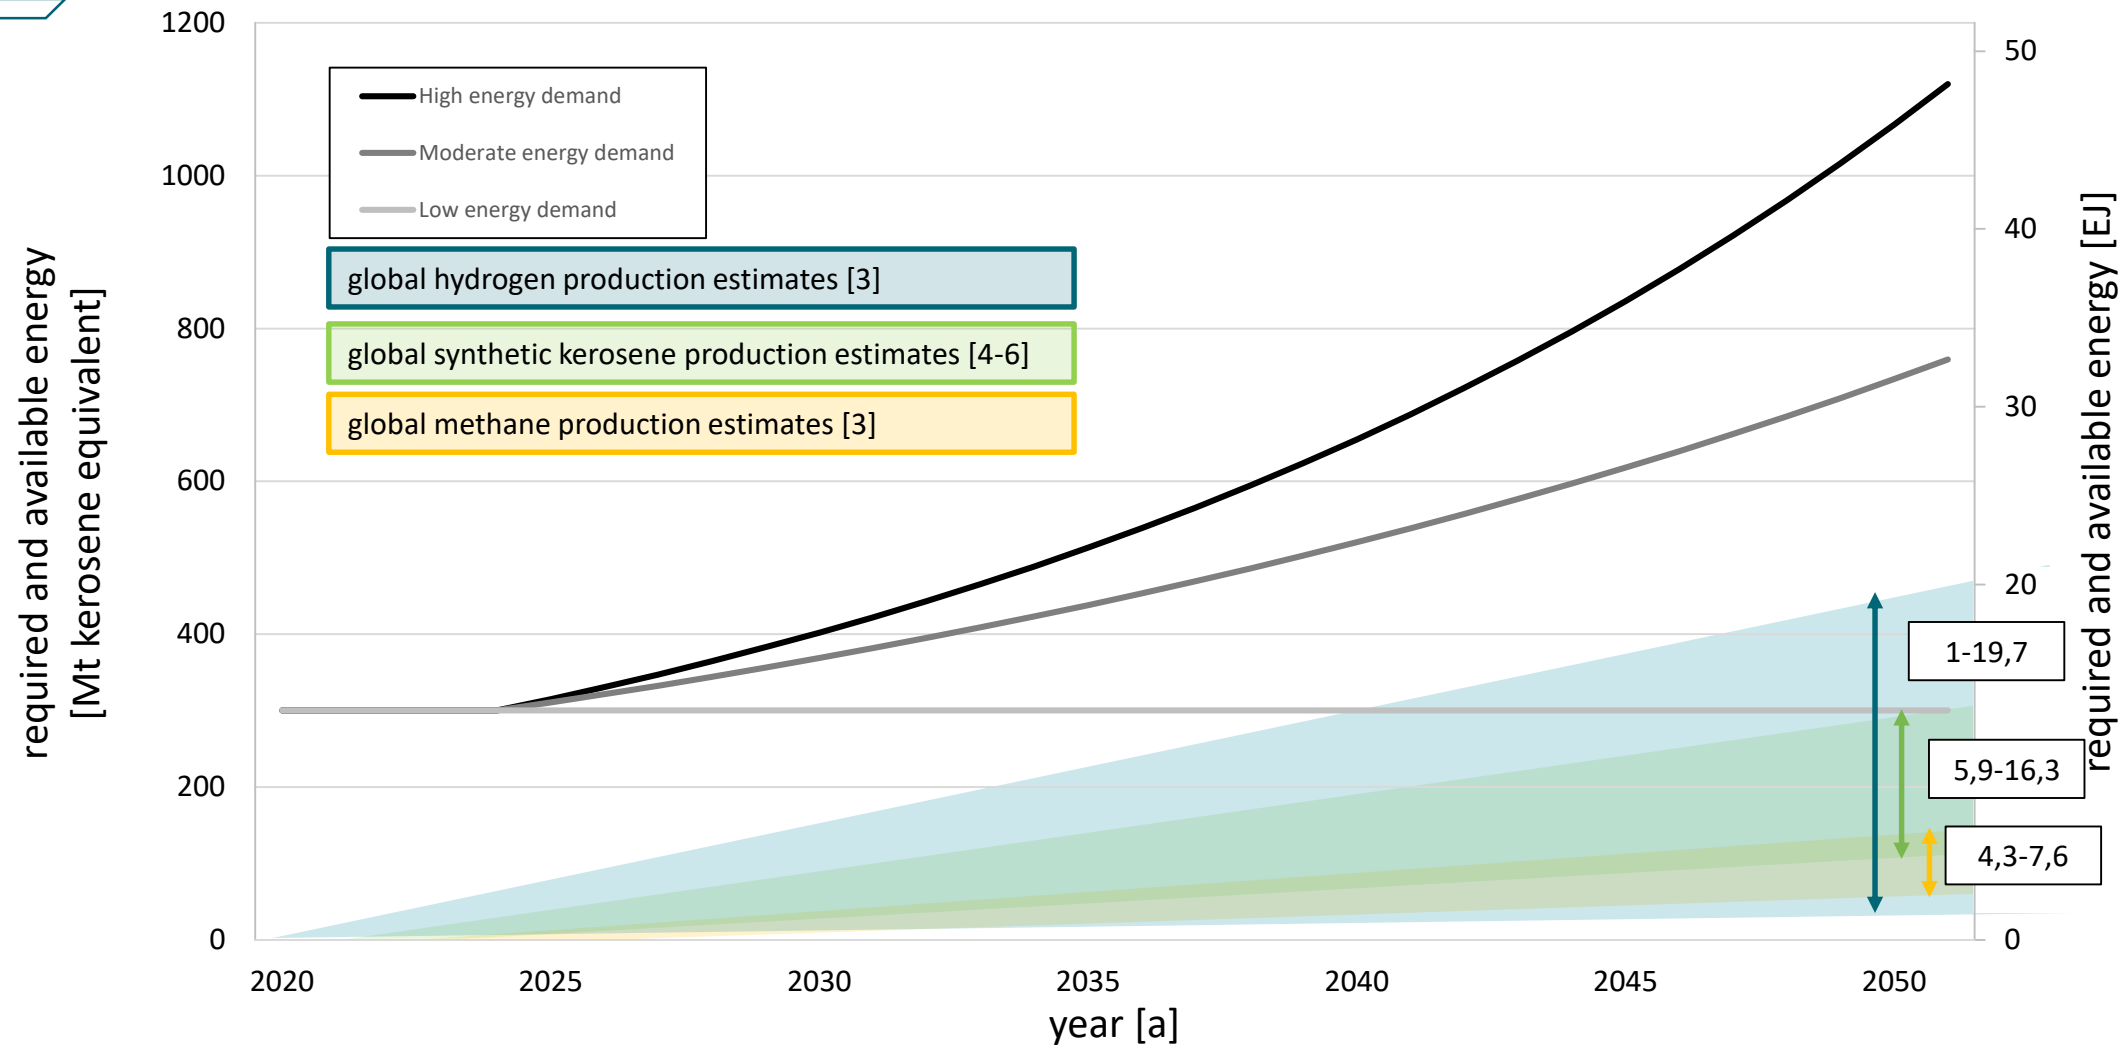

# Global aviation energy demand vs fuel option's availability

# Global aviation energy demand vs fuel option's availability

# Global aviation energy demand vs fuel option's availability

# Assessment 2050

# Scenarios for synthetic kerosene

# Scenarios for hydrogen

# Conclusions

## Socio-Economic Preconditions

### SSP1

- improved resource efficiency
- reduced overall energy use

### SSP2

- sustainable development goals are slowly achieved
- overall intensity of resource and energy use declines

## Air Transport System's Preconditions

### Hydrogen

- global logistics infrastructure
- provision at several airports
- development of a hydrogen aircraft

### Synthetic Kerosene

- use without fossil blending component

## Key Lever

1. development of aviation's energy demand more important than availability of renewables
2. ramp-up of production capacities
3. willingness to cover the cost of the energy transition

# Static criteria – fuel conversion efficiency

# Motivation – aviation energy demand scenarios

(5, 6)

# Matching Socioeconomic and Energy Scenarios

## Socio-economic scenario

### SSP1 – Sustainability

- Emphasis on economic growth shifts towards a **broader emphasis on human well-being**
- **Consumption** is oriented toward **low material growth and lower resource and energy intensity**

## Scenario for energy availability

### IEA Net Zero Emissions Scenario (NZE)

- Net-zero emissions in 2050
- key energy related UN SDGs are met
- **1,5° goal is achieved with 50% probability**

## Scenario for energy required

### Low

- low demand growth and energy efficiency improvements balance each other
- constant aviation energy required

### SSP2 – Middle of the Road

- Social, economic and technological **trends do not shift markedly from historical patterns**
- Slow progress in achieving sustainable development goals
- Overall **intensity of resource and energy use declines**

### IEA Stated Policies Scenario (STEPS)

- Trends based on existing and policies under development
  - Development without any additional major steer from policy
- economic growth outpaces energy efficiency improvements
- aviation energy demand increases

### Moderate

- 4,5 %/a demand growth
- 1,0 %/a fuel efficiency improvements

### High

- 5 %/a demand growth
- fuel efficiency diminish (0 %/a)
